

Q HUMAN

SHAPED FOR REAL PRODUCTION

A focused vocal-processing environment created to reduce the rigid, metallic and overly perfect qualities often heard in AI-generated, dubbed and heavily edited voices.

PRODUCT CATALOGUE

USER GUIDE

WORKFLOW REFERENCE

Designed and developed by Quantum Climb

A controlled path from synthetic to expressive

Q HUMAN is designed for dialogue, localization, narration, podcast, commercial and vocal-production workflows. It combines profile-aware spectral shaping, subtle nonlinear body, controlled timing and spatial treatment inside a fast, preset-led interface.

The production problem

AI and highly edited vocals can sound spectrally rigid, mechanically timed, thin, over-bright or disconnected from the production around them.

The Q HUMAN approach

Shape several complementary dimensions together, from one central Humanize macro or through individual controls, while preserving a clear before-and-after workflow.

WHAT IT CAN CONTRIBUTE

- Reduce the perception of metallic, over-processed or overly uniform vocal tone.
- Restore a more grounded sense of body and presence to thin material.
- Introduce controlled timing, emotional and spatial variation without turning the vocal into a special effect.
- Provide fast starting points for dialogue, narration, broadcast, localization and selected singing applications.
- Create two independent processing ideas using the built-in A/B comparison system.

DESIGN PRINCIPLE

Q HUMAN is a finishing and character-shaping tool. It is not a pitch shifter, compressor, noise-removal system or conventional reverb replacement. Use corrective editing, denoising, pitch correction and dynamics processing elsewhere in the chain when the production requires them.

One screen. One clear vocal decision.

The interface presents input condition, processing intent and output result in one uninterrupted view. Purple represents the incoming or 'Before' character; amber represents the processed or 'After' character.

#	AREA	PURPOSE
1	Preset browser	Select one of 15 factory starting points. The asterisk indicates a modified preset.
2	A/B slots	Store and compare two independent presets and parameter states.
3	Humanize	Global macro that coordinates the overall intensity of the humanization treatment.
4	Before / After	Animated visual feedback for the incoming and processed vocal character.
5	Input / Output	Level readouts and meters help maintain sensible gain staging.
6	Voice Profile	Guides the processing toward the source voice and production context.
7	Detail controls	Emotion, Natural Timing, Voice Body, Clarity, Space and Stereo.
8	Stereo HQ / Advanced	Enhanced stereo mode plus input and output calibration access.

Macro speed with detailed control

Begin with a preset and the Humanize control. Refine only what the recording needs. Smaller changes usually preserve identity and intelligibility more naturally than pushing every control upward.

HUMANIZE

The central macro. Coordinates the overall depth of the vocal-humanization treatment. Start around 30-60% and increase only while the vocal continues to sound believable.

EMOTION

Shapes the perceived expressiveness and variation of the result. Useful when a voice feels emotionally flat or overly uniform.

NATURAL TIMING

Introduces controlled micro-timing movement intended to reduce rigid cadence. High settings can be stylistic; verify lip-sync and dialogue timing.

VOICE BODY

Adds weight and warmth through profile-guided low-frequency shaping and subtle saturation. Reduce it if the vocal becomes cloudy or oversized.

CLARITY

Applies profile-aware resonance control, dynamic sibilance management and presence shaping. It is designed to improve focus without hollowing the voice.

SPACE

Controls spatial depth and short movement around the voice. It is not a conventional reverb control. Use conservatively for dialogue and localization.

STEREO

Adjusts perceived width while retaining mono awareness. Keep spoken-word leads centered unless the production specifically calls for width.

STEREO HQ

Enables the enhanced stereo processing mode. Compare in stereo and mono, especially on headphones and compact speakers.

GAIN AND MONITORING

Use Input Trim to establish a healthy working level before processing. Use Output Trim to compare at similar perceived loudness. A louder result can seem better even when the processing is not. The meters are production guides; your DAW meters remain the final reference for delivery levels.

Tell Q HUMAN what kind of voice it is hearing

Voice Profiles are not presets. They guide the underlying frequency and dynamics behavior toward a vocal type or production context; presets then set the complete control combination.

Neutral Dialogue

Balanced starting point for general spoken-word material.

Male Dialogue

Guides body, resonances and sibilance ranges toward lower-register speech.

Female Dialogue

Guides the processing toward higher-register speech and corresponding sibilance regions.

Warm Narration

Optimized for intimate, rounded narration and long-form voice work.

Commercial Voice

A more forward context for advertising, presentation and promotional delivery.

Character Voice

Designed for stylized, animated or strongly performed dialogue.

Audiobook

A restrained context for sustained listening and close, intelligible narration.

Podcast

A practical spoken-word profile for conversational, close-microphone material.

PROFILE SELECTION TIP

Choose the profile by the source voice first, then audition presets. If two profiles both sound plausible, compare them at matched output level and select the one that preserves the speaker's identity most naturally.

Fifteen production-ready starting points

Every preset sets a distinct combination of Humanize, profile, detail controls and stereo behavior. Presets are starting points, not final mastering targets. An asterisk beside the preset name indicates that a control has been changed.

ID	PRESET	CHARACTER	BEST STARTING USE
0	Natural Conversation	Balanced dialogue humanization for everyday speech and natural conversational delivery.	General dialogue, interviews, dubbing
1	Cinematic Dialogue	A more dimensional, expressive presentation intended for dramatic spoken material.	Film dialogue, trailers, dramatic narration
2	Warm Narration	Adds warmth and a smoother narrative character while retaining intelligibility.	Narration, documentaries, storytelling
3	Commercial Voice	A confident, shaped treatment for promotional and advertising delivery.	Advertising, brand films, presentations
4	Documentary	Balanced room, timing and tonal movement for factual long-form storytelling.	Documentary voice-over, factual content
5	Audiobook	An intimate, restrained and comparatively dry presentation for extended listening.	Audiobooks, long-form narration
6	Energetic Presenter	Stronger expression and forward character for lively delivery.	Promos, explainers, high-energy presentation
7	Soft Emotional	Gentler vocal shaping intended to preserve vulnerability and emotional nuance.	Emotional dialogue, soft singing, intimate VO

Clean-up, recovery and localization

The second preset group includes restrained broadcast options and specialized repair starting points. Repair presets cannot reconstruct information absent from the recording; they are designed to reduce perception of common artifacts.

ID	PRESET	CHARACTER	BEST STARTING USE
8	Broadcast Clean	Controlled, polished spoken-word shaping with a restrained production character.	Broadcast dialogue, podcasts, clean VO
9	Close Microphone	Adds body while keeping the spatial impression tight and intimate.	Close-mic podcasting, intimate narration
10	Metallic AI Repair	Targets rigid and metallic AI-vocal characteristics with deeper corrective shaping.	Metallic synthesis artifacts, AI dubbing
11	Harsh Sibilance Repair	A clarity-led repair starting point for aggressive consonants and resonance.	Sibilant or harsh AI speech
12	Thin Voice Recovery	Restores perceived body and support to vocals lacking weight.	Thin dialogue, lightweight synthetic voices
13	Stereo Natural	Introduces controlled width and spatial movement while prioritizing compatibility.	Stereo vocal production, selected singing
14	Localization Neutral	A conservative low-depth setting designed for dubbing and localization consistency.	Multilingual dubbing, localization pipelines

A/B PRESET COMPARISON

Slot A and Slot B preserve independent presets and parameter states. Build a conservative treatment in A, a stronger alternative in B, then compare at similar output loudness. Modified states are marked with an asterisk.

From raw voice to final delivery

Q HUMAN is most effective when inserted at a deliberate point in the vocal chain. The following workflows are practical starting structures, not mandatory signal paths.

AI DUBBING + LOCALIZATION

1. Edit and clean the source. 2. Apply essential denoising or de-clicking. 3. Insert Q HUMAN and begin with Localization Neutral, Natural Conversation or Metallic AI Repair. 4. Match output loudness. 5. Add final dynamics and delivery limiting only if required.

NARRATION + AUDIOBOOK

1. Establish clean gain staging. 2. Select the closest Voice Profile. 3. Start with Audiobook, Warm Narration or Documentary. 4. Adjust Voice Body and Clarity in small increments. 5. Keep Space restrained for long-form listening.

COMMERCIAL + PRESENTER

1. Begin with Commercial Voice, Energetic Presenter or Broadcast Clean. 2. Increase Humanize only until the delivery becomes engaging. 3. Check harsh consonants. 4. Use separate compression after Q HUMAN if tighter dynamics are needed.

SINGING + CREATIVE VOCALS

1. Complete pitch and timing correction first. 2. Try Soft Emotional, Thin Voice Recovery or Stereo Natural. 3. Verify phase and mono compatibility. 4. Use Q HUMAN subtly; it is not a vocal pitch transformation processor.

RECOMMENDED FIRST PASS

- Place Humanize at 35-50%, choose the source Voice Profile, then audition three relevant presets.
- Level-match bypass and processed playback before deciding which version is better.
- Adjust only one detail control at a time and listen in the context of the full production.
- Check headphones, studio monitors and mono playback before committing the result.

Measured on real vocal material

The installed Windows VST3 was exercised by an external host harness across ten real vocal stems and all fifteen factory presets. The following statements describe measured engineering checks; final aesthetic quality remains a listening decision.

150 REAL-VOCAL PRESET PASSES	0 NAN / INF SAMPLES	0 SAFETY CEILING CONTACTS	0 REPORTED LATENCY SAMPLES
---	-------------------------------	--	---

CORPUS	10 real 24-bit / 48 kHz stereo vocal stems covering natural dialogue, AI dubbing, sibilant and metallic voices, narration, commercial voice and singing.
PROCESSING	All 10 stems completed all 15 preset passes through the dynamically loaded installed VST3 without a processing crash.
HEADROOM	At calibrated nominal input levels, no rendered sample touched the internal -1.00 dBFS emergency ceiling.
TRUE PEAK	Corrected loudness-matched evaluation renders were kept at or below -0.10 dBTP according to the audit harness.
CPU	At 48 kHz, five-run averages consumed approximately 5.1-5.3% of the available block-time budget across tested block sizes from 32 to 1024 samples on the audit computer.
STATE	A/B slots were verified to preserve independent preset identities and parameter states.

IMPORTANT INTERPRETATION

Technical stability does not by itself prove that every preset is ideal for every voice. Vocal identity, language, performance, recording quality and production context materially affect the result. Audition, level-match and use professional judgment. The external listening evaluation remains the appropriate final test of aesthetic preference.

From download to first sound

Q HUMAN is delivered as a Windows VST3 bundle. The complete bundle must remain intact; do not extract or distribute only the inner binary.

01	Close the DAW	Quit the host before copying or replacing the plugin.
02	Extract the package	Unzip the complete Q HUMAN.vst3 bundle.
03	Install the bundle	Copy Q HUMAN.vst3 to C:\Program Files\Common Files\VST3\
04	Rescan VST3 plugins	Open the DAW, rescan if necessary, then load Q HUMAN on a vocal track.
05	Choose and compare	Select a Voice Profile, audition a preset, set Humanize, match levels, and compare A/B.

CURRENT RELEASE PROFILE

FORMAT	VST3
PLATFORM	Windows x86-64
TESTED SAMPLE RATE	48 kHz in the documented real-vocal audit
REPORTED LATENCY	0 samples
FACTORY PRESETS	15
VOICE PROFILES	8
INSTALL LOCATION	C:\Program Files\Common Files\VST3\Q HUMAN.vst3

Compatibility with a particular DAW, operating-system revision or computer should be confirmed before purchase or deployment. Rescan instructions differ by host.

Reliable results begin with responsible gain staging

Keep the original recording available, compare at equal perceived loudness and save project versions before committing important production changes.

OBSERVATION	RECOMMENDED ACTION
The vocal sounds too dark or distant	Reduce Humanize, Clarity or Space. Compare a more neutral preset and restore output level for a fair judgment.
The vocal becomes too heavy	Reduce Voice Body or select a more suitable Voice Profile.
The stereo image feels unstable	Reduce Stereo, disable Stereo HQ temporarily and check the track in mono.
The result is much quieter	Use Output Trim for monitoring comparison, but preserve delivery headroom and avoid clipping.
A preset name shows an asterisk	The active preset has been modified. Switch presets or restore the desired values deliberately.
The plugin does not appear	Confirm the complete bundle is in the common VST3 folder, restart the DAW and perform a full plugin rescan.

THE VOCAL IS STILL THE PERFORMANCE

Q HUMAN is designed to help technology serve expression - not replace it. Its purpose is to give producers, localization teams and creators a controlled way to move synthetic or heavily edited vocal material closer to a believable, emotionally useful production result.
